Sol. Colloidal solution particles can be separated using parchment paper.

True solution can pass through parchment paper while colloidal particle can not pass.

8. Metal in complex have low oxidation state when ligands are :

- (1) Good π acceptor. (2) Good σ donor.
 (3) Poor σ donor. (4) Poor π donor.

Ans. (1)

Sol. When metal has low oxidation state, it has more electron density in d orbital. So it has more tendency to back donate electrons. Thus compound must have good π acceptor ligand.

Sol. Vander waal equation for 1 mole

$$\left(P + \frac{a}{V_m^2}\right)(V_m - b) = RT$$

V_m = volume of 1 mole of gas

At high pressure (moderate temp.)

V_m will be low

so b can't be neglected in comparison to V_m

but $\frac{a}{V_m^2}$ can be neglected as compared to much higher values of P.

Then vander Waals' equation will be

$$P(V_m - b) = RT$$

$$PV_m - Pb = RT$$

$$\frac{PV_m}{RT} = \frac{Pb}{RT} + 1$$

$$Z = \frac{Pb}{RT} + 1$$

$$2 = 1 + \frac{99 \times b}{0.083 \times 298}$$

$$b = \frac{0.083 \times 298}{99} = 0.25 = 25 \times 10^{-2} \text{ Lit/mole}$$

12. Arrange following according to decreasing order of energy

(a) $n = 3, l = 0, m = 0, s = -\frac{1}{2}$

(b) $n = 3, l = 1, m = -1, s = +\frac{1}{2}$

(c) $n = 3, l = 2, m = +2, s = +\frac{1}{2}$

(d) $n = 4, l = 0, m = 0, s = +\frac{1}{2}$

(1) $c > d > b > a$ (2) $d > c > b > a$ (3) $a > b > c > d$ (4) $c > d > a > b$

Ans. (1)

Sol. Energy depends on $(n + l)$ so correct order $\Rightarrow 3d > 4s > 3p > 3s$

13. In 100 gram water a solute is added & vapour pressure of solution is half of the pure solvent. The vapour pressure of pure water is 23.76 mm of Hg then find the number of mole of solute added.
