### **Branches of Linguistics**

Sociolinguistics is one of those branches of linguistics that serves a crucial function in our understanding and application of linguistics. Because language is a deeply human and social construct, socio-linguistics deals with the effect of different aspects of society on language. It studies the interaction of languages as people from different cultures and heritage interact. One example of sociolinguistics is the emergence of different dialects of a language, as is the study of language confluence, such as Hindi and English being spoken together as Hinglish.

Applied linguistics involves the practical use of linguistics to solve real-life problems. Linguists make use of other fields such as sociology, psychology, anthropology, etc. to better understand how to apply their study of linguistics to help people and solve real-world concerns.

It is best to understand such branches of linguistics with examples. Applied linguistics can be seen in speech therapy, translating texts from different cultures or ages, and even in the process of second-language acquisition.

Computational linguistics is a relatively new branch of linguistics that deals with the use of language by computers and programs. Such branches of linguistics leverage computer science to analyse, model, and produce speech. One example of computational linguistics is the AI-driven Google Assistant that uses natural language processing and speech recognition systems to do your bidding.

**Indian Tradition of Linguistics**

Sanskrit treatise on grammar was written in the 6th to 5th century BCE by the Indian grammarian Panini. This work set the linguistic standards for Classical Sanskrit. It sums up in 4,000 sutras the science of phonetics and grammar that had evolved in the Vedic religion. Panini divided his work into eight chapters, each of which is further divided into quarter chapters. Beyond defining the morphology and syntax of Sanskrit language, Ashtadhyayi distinguishes between usage in the spoken language and usage that is proper to the language of the sacred texts.

The Ashtadhyayi is generative as well as descriptive. With its complex use of metarules, transformations, and recursions, the grammar in Ashtadhyayi has been likened to the Turing machine, an idealized mathematical model that reduces the logical structure of any computing device to its essentials.
