Question Number : 1 Question Id : 4641991505 Question Type : MCQ Option Shuffling : No  
Correct Marks : 5 Wrong Marks : 1

**Read the passage carefully and answer the question given below by selecting the correct option:**

On September 30, 2001, I (Dr A P J Abdul Kalam) found myself on a journey from Ranchi to Bokaro in Jharkhand. The helicopter carrying me crashed just before landing, its engine failing with a thud upon impact. Miraculously, all on board escaped unharmed. Grateful to God, I proceeded with my scheduled programme in Bokaro, unfazed by the incident. That night, doctors suggested a tranquilliser to ease perceived shock, leading to an early and disturbed sleep, filled with contemplation.

Amidst this intense dream, I stood in a moonlit desert with five revered figures: Mahatma Gandhi, Albert Einstein, Emperor Asoka, Abraham Lincoln, and Caliph Omar. Asoka's reflection on the Kalinga war symbolised a shift from conquest to compassion, inspiring a doctrine of non-violence, Ahimsa Dharma.

In this profound dream-conversation, these figures shared wisdom on humanity's deep divisions caused by violence. They emphasised peace, equality, and the significance of ethical values in human consciousness. Asoka, having witnessed the consequences of his victories, highlighted the futility of causing suffering and the triumph of a peaceful kingdom.

Awakening from this vivid dream, I contemplated the contrasting forces of good and destruction in the world. The challenges faced by humanity, from conflicts to natural disasters and terrorism, prompted deep reflection. Yet, despite these challenges, I held a determined belief in finding an everlasting solution.

Motivated by this dream and a desire to contribute to the greater good, I made a significant decision. Shifting focus from my scientific career, awards, and teams, I aimed to discover India's true essence in its children. This marked a transcendence of personal achievements, emphasising the importance of nurturing enlightened individuals and fostering the inner, higher self in the youth. My commitment was to contribute to the enduring intelligence of India through meaningful interaction with joyous, young minds.

A P J Abdul Kalam 'Ignited Minds'

What event prompted the author's contemplation in the passage?

1. Meeting the revered figures
2. The helicopter crash
3. The scheduled programme in Bokaro
4. Doctors' suggestions for a tranquilliser

Question Number : 2 Question Id : 4641991506 Question Type : MCQ Option Shuffling : No  
Correct Marks : 5 Wrong Marks : 1

Correct Marks : 5 Wrong Marks : 1

**Read the given passage and answer the question that follows by selecting the correct option:**

***Five a Day***

A new study backs up the long-standing nutritional guideline that consuming five daily servings of a variety of fruits and vegetables is linked to longevity. People who daily consumed specifically two fruits and three vegetables had a 12 per cent lower risk of death from cardiovascular disease, a 10 per cent lower risk from cancer, and a 35 per cent lower risk from respiratory disease, compared with people who ate just two daily servings.

One 'serving' is 125 millilitres of any vegetables or fruits, or 250 millilitres of salad greens. You get the same beneficial vitamins, minerals and fibre in both, but vegetables are lower in calories and sugar, which is why the guidelines recommend higher consumption levels for them. The findings, included two studies of more than 1,00,000 American men and women who were followed for upto 30 years. Those studies were then added to 24 other studies from across the globe to conduct one large meta-analysis on more than 1.8 million participants.

Variety is the key, because different fruits and vegetables contain different beneficial nutrients and antioxidants. Almost all fruits and vegetables were associated with lower mortality but there were exceptions. Fruit juices and starchy vegetables such as peas, corn and potatoes were not associated with reduced risk of death or chronic diseases. It may be due to their higher glycaemic load .

Your five daily servings can be met from a variety of fresh, frozen or canned fruits and vegetables, whether conventional or organic. Whichever options are available, affordable and appealing are good choices.

Studies show that freezing and canning preserves nutrients, which makes these foods even more nutrient-dense than their fresh counterparts. They are good options for people whose barriers to consuming enough servings per day include the high cost, low access, poor quality and lack of variety of fresh fruits and vegetables.

Complete the sentence :

The research study referred to in the given passage claims that the daily consumption of five servings of a variety of fruits and vegetables\_\_\_\_\_.

1. can keep us satisfied and make us immortal.
2. can lower the risk of diseases and increase life-span.
3. can make people completely disease free and invincible.
4. is an age old guideline to cure infertility.

**Read the given passage and answer the questions that follows by selecting the correct option:**

***Five a Day***

Question Number : 13 Question Id : 4641991517 Question Type : MCQ Option Shuffling : No  
Correct Marks : 5 Wrong Marks : 1

**Read the passage and answer the question given below by selecting the correct option:**

A recent study by researchers from Basel University and Munich Technical University challenges prior beliefs about the influence of different light colours on the human body's internal clock and sleep-wake rhythm. Unlike a previous study conducted on mice, this one suggests, that light colour may be less critical for the internal clock than originally thought.

Vision involves a complex process of perceiving various light wavelengths as colours and brightness in the brain. Photoreceptors in the retina convert light into electrical impulses, transmitted to ganglion cells in the retina and to the visual cortex in the brain. Specialised ganglion cells play a significant role in the internal clock, being sensitive to short-wavelength light at around 490 nanometers, perceived as blue. When activated by short-wavelength light, these cells signal "it's daytime" to the internal clock.

To explore the influence of light colour on the internal clock, the researchers exposed 16 healthy volunteers to blueish or yellowish light stimuli for one hour in late evening with a white light stimulus as a control condition. The light stimuli were designed to selectively activate the colour-sensitive cones in the retina, while maintaining consistent stimulation of the light-sensitive ganglion cells in all conditions. This allowed the researchers to directly check effects of light on the respective cone stimulation and, the colour of the light.

Contrary to the findings in mice, the study suggests that the colour of light, as encoded by the cones, may not significantly influence the human internal clock and sleep-wake rhythm. The current research contradicts the earlier finding that yellowish light had a stronger influence on the internal clock than blueish light. The results, published in "Nature Human Behaviour", imply that while light intensity and exposure duration remain crucial factors, the colour of light may not play as significant a role in influencing sleep and circadian rhythms as previously believed.

What does the recent study by researchers from the University of Basel and the Technical University of Munich challenge?

1. sleep-wake rhythms in mice
2. the impact of light colour on the internal clock
3. vision complexity in humans
4. the effect of sleep-wake cycle

Question Number : 14 Question Id : 4641991518 Question Type : MCQ Option Shuffling : No  
Correct Marks : 5 Wrong Marks : 1

**Read the passage and answer the question given below by selecting the correct option:**

A recent study by researchers from Basel University and Munich Technical University challenges prior beliefs about the influence of different light colours on the human body's internal clock and sleep-wake rhythm. Unlike a previous study conducted on mice, this one suggests, that light colour may be less critical for the internal clock than originally thought.

Vision involves a complex process of perceiving various light wavelengths as colours and brightness in the brain. Photoreceptors in the retina convert light into electrical impulses, transmitted to ganglion cells in the retina and to the visual cortex in the brain. Specialised ganglion cells play a significant role in the internal clock, being sensitive to short-wavelength light at around 490 nanometers, perceived as blue. When activated by short-wavelength light, these cells signal "it's daytime" to the internal clock.

To explore the influence of light colour on the internal clock, the researchers exposed 16 healthy volunteers to blueish or yellowish light stimuli for one hour in late evening with a white light stimulus as a control condition. The light stimuli were designed to selectively activate the colour-sensitive cones in the retina, while maintaining consistent stimulation of the light-sensitive ganglion cells in all conditions. This allowed the researchers to directly check effects of light on the respective cone stimulation and, the colour of the light.

Contrary to the findings in mice, the study suggests that the colour of light, as encoded by the cones, may not significantly influence the human internal clock and sleep-wake rhythm. The current research contradicts the earlier finding that yellowish light had a stronger influence on the internal clock than blueish light. The results, published in "Nature Human Behaviour", imply that while light intensity and exposure duration remain crucial factors, the colour of light may not play as significant a role in influencing sleep and circadian rhythms as previously believed.

What is the role of specialised ganglion cells in the internal clock, according to the passage?

1. transmitting electrical impulses to the visual cortex
2. converting light into electrical impulses
3. Getting destabilised by the sleep-wake rhythms
4. reacting strongly to short wavelength light

Question Number : 15 Question Id : 4641991519 Question Type : MCQ Option Shuffling : No

Correct Marks : 5 Wrong Marks : 1

**Read the passage and answer the question given below by selecting the correct option:**

A recent study by researchers from Basel University and Munich Technical University challenges prior beliefs about the influence of different light colours on the human body's internal clock and sleep-wake rhythm. Unlike a previous study conducted on mice, this one suggests, that light colour may be less critical for the internal clock than originally thought.

Vision involves a complex process of perceiving various light wavelengths as colours and brightness in the brain. Photoreceptors in the retina convert light into electrical impulses, transmitted to ganglion cells in the retina and to the visual cortex in the brain. Specialised ganglion cells play a significant role in the internal clock, being sensitive to short-wavelength light at around 490 nanometers, perceived as blue. When activated by short-wavelength light, these cells signal "it's daytime" to the internal clock.

To explore the influence of light colour on the internal clock, the researchers exposed 16 healthy volunteers to blueish or yellowish light stimuli for one hour in late evening with a white light stimulus as a control condition. The light stimuli were designed to selectively activate the colour-sensitive cones in the retina, while maintaining consistent stimulation of the light-sensitive ganglion cells in all conditions. This allowed the researchers to directly check effects of light on the respective cone stimulation and, the colour of the light.

Contrary to the findings in mice, the study suggests that the colour of light, as encoded by the cones, may not significantly influence the human internal clock and sleep-wake rhythm. The current research contradicts the earlier finding that yellowish light had a stronger influence on the internal clock than blueish light. The results, published in "Nature Human Behaviour", imply that while light intensity and exposure duration remain crucial factors, the colour of light may not play as significant a role in influencing sleep and circadian rhythms as previously believed.

Why were the light stimuli designed to differentially activate colour-sensitive cones in the retina?

1. to study the circadian rhythms
2. to maintain consistent stimulation of ganglion cells
3. to check the effect of light on the cone stimulation
4. to explore vision complexity

Question Number : 16 Question Id : 4641991520 Question Type : MCQ Option Shuffling : No  
Correct Marks : 5 Wrong Marks : 1

**Read the passage and answer the question given below by selecting the correct option:**

A recent study by researchers from Basel University and Munich Technical University challenges prior beliefs about the influence of different light colours on the human body's internal clock and sleep-wake rhythm. Unlike a previous study conducted on mice, this one suggests, that light colour may be less critical for the internal clock than originally thought.

Vision involves a complex process of perceiving various light wavelengths as colours and brightness in the brain. Photoreceptors in the retina convert light into electrical impulses, transmitted to ganglion cells in the retina and to the visual cortex in the brain. Specialised ganglion cells play a significant role in the internal clock, being sensitive to short-wavelength light at around 490 nanometers, perceived as blue. When activated by short-wavelength light, these cells signal "it's daytime" to the internal clock.

To explore the influence of light colour on the internal clock, the researchers exposed 16 healthy volunteers to blueish or yellowish light stimuli for one hour in late evening with a white light stimulus as a control condition. The light stimuli were designed to selectively activate the colour-sensitive cones in the retina, while maintaining consistent stimulation of the light-sensitive ganglion cells in all conditions. This allowed the researchers to directly check effects of light on the respective cone stimulation and, the colour of the light.

Contrary to the findings in mice, the study suggests that the colour of light, as encoded by the cones, may not significantly influence the human internal clock and sleep-wake rhythm. The current research contradicts the earlier finding that yellowish light had a stronger influence on the internal clock than blueish light. The results, published in "Nature Human Behaviour", imply that while light intensity and exposure duration remain crucial factors, the colour of light may not play as significant a role in influencing sleep and circadian rhythms as previously believed.

What did the prior study on mice suggest about the impact of colour of light on the human internal clock and sleep-wake rhythm?

1. The colour of light has a significant impact on both.
2. The colour of light is not critical for sleep-wake rhythm.
3. It has no influence on sleep patterns.
4. It is mainly dependent on vision complexity.

Question Number : 17 Question Id : 4641991521 Question Type : MCQ Option Shuffling : No  
Correct Marks : 5 Wrong Marks : 1

**Read the passage and answer the question given below by selecting the correct option:**

A recent study by researchers from Basel University and Munich Technical University challenges prior beliefs about the influence of different light colours on the human body's internal clock and sleep-wake rhythm. Unlike a previous study conducted on mice, this one suggests, that light colour may be less critical for the internal clock than originally thought.

Vision involves a complex process of perceiving various light wavelengths as colours and brightness in the brain. Photoreceptors in the retina convert light into electrical impulses, transmitted to ganglion cells in the retina and to the visual cortex in the brain. Specialised ganglion cells play a significant role in the internal clock, being sensitive to short-wavelength light at around 490 nanometers, perceived as blue. When activated by short-wavelength light, these cells signal "it's daytime" to the internal clock.

To explore the influence of light colour on the internal clock, the researchers exposed 16 healthy volunteers to blueish or yellowish light stimuli for one hour in late evening with a white light stimulus as a control condition. The light stimuli were designed to selectively activate the colour-sensitive cones in the retina, while maintaining consistent stimulation of the light-sensitive ganglion cells in all conditions. This allowed the researchers to directly check effects of light on the respective cone stimulation and, the colour of the light.

Contrary to the findings in mice, the study suggests that the colour of light, as encoded by the cones, may not significantly influence the human internal clock and sleep-wake rhythm. The current research contradicts the earlier finding that yellowish light had a stronger influence on the internal clock than blueish light. The results, published in "Nature Human Behaviour", imply that while light intensity and exposure duration remain crucial factors, the colour of light may not play as significant a role in influencing sleep and circadian rhythms as previously believed.

What is the key implication of the research study's results for our understanding of sleep and circadian rhythms?

1. Colour of light is the sole determinant of sleep and circadian rhythms.
2. Light intensity plays a crucial role in sleep and circadian rhythms.
3. Light intensity and exposure duration are the secondary factor.
4. Light colour may not play as significant a role as previously believed.

Question Number : 18 Question Id : 4641991522 Question Type : MCQ Option Shuffling : No  
Correct Marks : 5 Wrong Marks : 1

**Read the following passage and answer the question that follows by selecting the correct option:**

In the quaint village of Malgudi, nestled between lush green fields and swaying palm trees, lived a man named Raghavan . He was known for his peculiar habit of collecting colourful pebbles from the riverbank every morning. The villagers, initially perplexed by this ritual, soon came to see it as a unique aspect of Raghavan' s character.

One day, as the Sun painted the sky in hues of orange and pink, Raghavan discovered a pebble unlike any he had seen before. It shimmered with an iridescent glow, casting a magical aura around it. Intrigued, he decided to keep this special pebble in a small wooden box on his windowsill.

As days passed, rumours of the enchanted pebble spread across Malgudi, attracting visitors from neighbouring villages. They sought Raghavan's wisdom, believing that the mystical pebble held the answers to life's mysteries. Raghavan, a humble man, shared his insights with those who came, emphasising the beauty of simplicity and the magic within everyday moments.

Raghavan's neighbour, Murrku, jealous of his success, decided to rob him off the pebble and sell it off to a bidder at a good price. This was important as he would be able to buy the most expensive doll for his daughter Rae on her birthday. He spent days and nights planning for the robbery and was successful in fulfilling his target. But this did not make any difference in Rae's birthday celebration which had been complete with the simple toy made out of household stuff presented to her by Raghavan. Murrku understood Raghavan's simple philosophy of life. In the bid to get the most precious gift for his daughter, Murrku had forgotten Rae's birth day.

Complete the sentence:

Raghavan's pebble was unique due to \_\_\_\_\_.

1. its size
2. its iridescent glow
3. its shape
4. its weight

They sought Raghavan's wisdom, believing that the mystical pebble held the answers to life's mysteries. Raghavan, a humble man, shared his insights with those who came, emphasising the beauty of simplicity and the magic within everyday moments.

Raghavan's neighbour, Murrku, jealous of his success, decided to rob him off the pebble and sell it off to a bidder at a good price. This was important as he would be able to buy the most expensive doll for his daughter Rae on her birthday. He spent days and nights planning for the robbery and was successful in fulfilling his target. But this did not make any difference in Rae's birthday celebration which had been complete with the simple toy made out of household stuff presented to her by Raghavan. Murrku understood Raghavan's simple philosophy of life. In the bid to get the most precious gift for his daughter, Murrku had forgotten Rae's birth day.

Why did the villagers initially find Raghavan's pebble-collecting habit peculiar?

1. They were jealous of his collection.
2. They believed it brought bad luck.
3. They did not understand the reason for it.
4. They thought it was a waste of time.

Question Number : 21 Question Id : 4641991525 Question Type : MCQ Option Shuffling : No
