

Class-X

Science (086)

SECTION A

1. b) II and III

2. c) acidic, strong acid and weak base, less than 7

3. b)  $x - (\text{aq})$ ,  $y - (\text{g})$

4. a)  $x - \text{Na}_2\text{CO}_3$ ,  $y - \text{NH}_4\text{Cl}$

5. b) nucleus, chloroplast, vacuole, guard cell

c) part of the brain - hind brain

Name - cerebellum

6. a) less than 10 cm

Q.

3. d) Copper and tin ✓
4. c) i. ✓
5. ✓
6. ✓
7. ✓
8. ✓
9. ✓
10. d) Mice and Rabbit ✓
11. b) I, III, II, V, IV ✓
12. b) 'I' is a displacement reaction and 'II' is a double displacement reaction. ✓
13. b) violet and Red ✓
14. c) 'x' and 'y' only ✓
15. d) is same at all points. ✓
16. d) corner ✓

17. d) Assertion (A) is false, but Reason (R) is true.

18. a) Both Assertion (A) and Reason (R) are true and  
Reason (R) is the correct explanation of (A).

19. c) Assertion is true, but Reason (R) is false.

20. a) Both Assertion (A) and Reason (R) are true and  
Reason (R) is the correct explanation of (A).

SECTION B

21.

The given reaction :

A redox reaction is a reaction in which both oxidation and reduction is taking place. In this reaction,  $\text{MnO}_2$  is getting reduced to  $\text{MnCl}_2$  as  $\text{O}_2$  is ~~reduced~~, ~~from~~ removed from it.

HCl is getting oxidised as  $\text{Cl}_2$  is separated and  $\text{H}_2\text{O}$  is formed. Hydrogen is removed from HCl and is getting oxidised to form  $\text{H}_2\text{O}$  here. Thus, the given reaction is a redox reaction.

Q2

a)

### Movement of leaves

of a sensitive plant.

### Movement of a sheet

towards light

1. This is not a growth related movement and is due to a stimulus (Nastic movement)

2. This is non-directional.

3. Movement is carried out by movement of water which

is taken from the leaves to older part. This causes the leaf to shrink.

3. Movement is carried out

due to hormone like Auxin which diffuses to area of sheet away from sunlight and regulates cell elongation in area of sheet present in the shade, which causes the plant to bend towards sunlight.

23. The enzyme salivary amylase is present in the fluid in our mouth cavity. salivary gland produces the salivary amylase. In the absence of this enzyme, digestion of complex starch to simple sugar (Maltose) would be difficult, hence abecting the digestive process. Along with it, the sight swallowing of food would also be difficult as salivary amylase makes the food wet to easily flow down the oesophagus.

24.

The above stated question can be solved by Ohm's law, which indicates that potential difference ( $V$ ) across the conductor is directly proportional to the current ( $I$ ) flowing through it.

$$\checkmark \propto I \quad \text{or} \quad V = IR$$

where  $R$  is the constant and is the characteristic

of a conductor to resist the flow of the current through it.  
When  $V$  &  $I$  and  $R$  is constant,

if  $V$  decreases to  $\frac{V}{4}$   $I$   $\frac{1}{4}$  th of initial value

then following Ohm's law

$I$  (current) too decreases to  $\frac{1}{4}$  th of initial value,

i.e., current becomes  $\frac{I}{4}$  Amperes.

25.

(A)

Medium 'B'

When light is incident from Medium 'A' to Medium 'B' we

find, that the ray is deflected

towards the normal.

This indicates that Medium

'B' is denser w.r.t. medium

A.

Medium 'A'

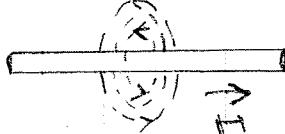

b) Speed of light in Medium A  $\rightarrow v_A$  [Ans]  
 Speed of light in Medium B  $= v_B$  [Ans]

$$n_2 = \frac{v_1}{v_2} = \frac{v_A}{v_B} \quad [\text{Ans}]$$

using formula  
 Refractive index of  $\rightarrow$  speed of light in A  
 B w.r.t. A  $\rightarrow$  speed of light in B

Q

Ques.

- a)
- Right Hand Thumb Rule
- 
- It shows the direction of one "straight thumb" on a conductor indicates the direction of current, then the direction in which our fingers of right hand wrap around the conductor indicates the direction of magnetic field around the straight current carrying wire.

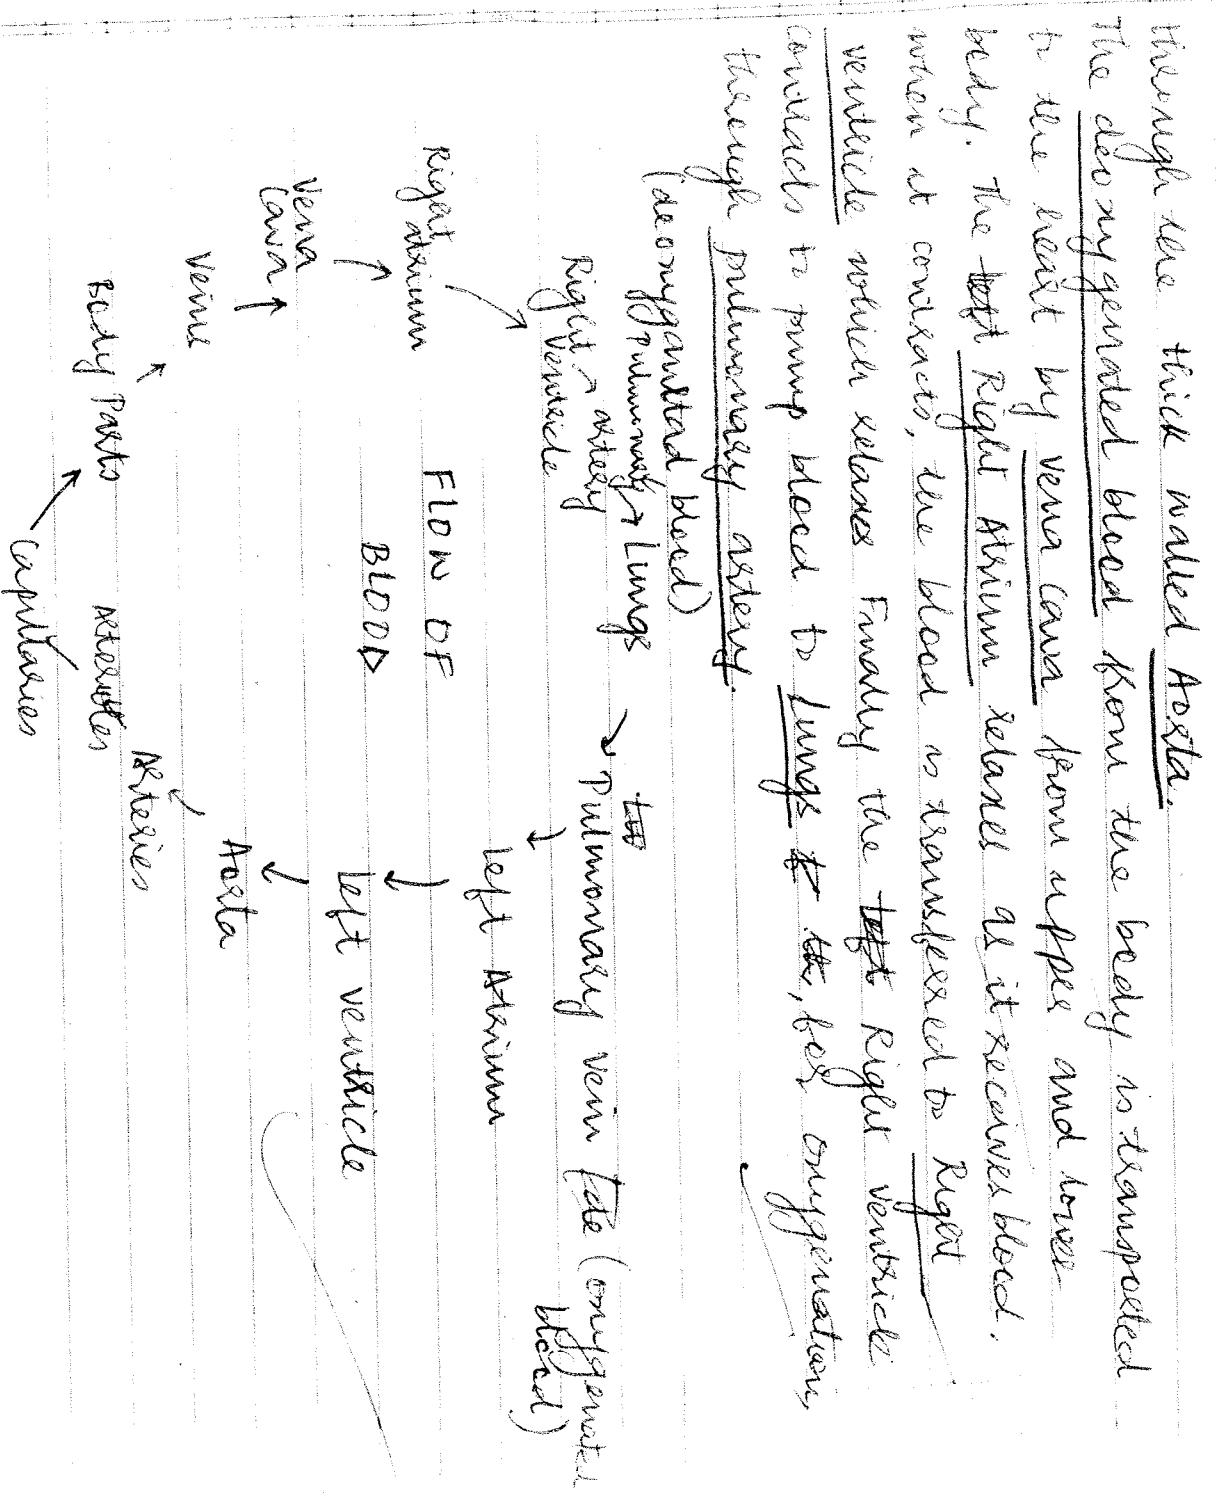

(b)

### Fleming's Left Hand Rule

If we place our forefingers, middle fingers and thumbs in such a way that they are mutually perpendicular, then the direction of our middle finger gives the direction of current direction of forefinger indicates direction of magnetic field, then the thumb indicates the direction of force experienced by the conductor.

### SECTION C

The oxygenated blood from the lungs is transported to the heart for pumping through the pulmonary vein. The pulmonary vein transports blood to the left atrium which relaxes as it receives it. When contracted no transport blood to the left ventricle which relaxes, when the left atrium contracts, blood is pumped to all organs

$\text{CaCO}_3$  - Calcium carbonate (chemical name)  
 $\text{CaCO}_3$  (chemical formula)

$\hookrightarrow$  insoluble in water, white colour  
Caustic

2.

(a) The gland is Adrenal Gland which secretes the hormone ~~ester~~ Adrenalin, during scary situations.

Other the main target organs of this hormone include the heart, when Adrenalin is secreted;

- (1) The blood supply to skin and digestive system reduces due to constriction contraction of ~~arteries~~ arteries near muscles.
- (2) Heart pumps more blood to provide oxygen to the muscles.

- (3) Breathing rate increases due to contraction of diaphragm and rib muscles.

Expt (a)

$\text{Zn} + \text{HgO} \rightarrow \text{ZnO} + \text{Hg}$

This indicates as indicated by the increased  
heat, of the vessel / test tube in which the  
reaction is performed.

Expt (b)

$\text{Zn} + \text{HgSO}_4 \rightarrow \text{ZnSO}_4 + \text{Hg(g)}$

presence of Hg gas evolved can be tested by  
lighting a match stick near it. A pop sound is  
heard.

Expt (c)

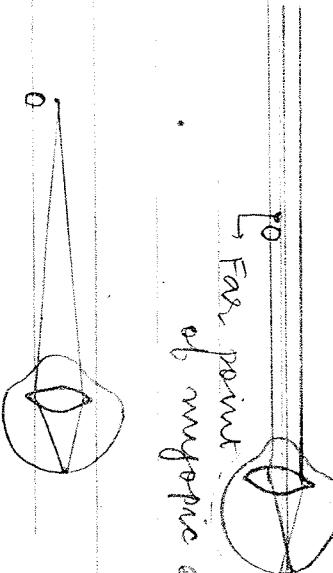

$\text{CuSO}_4 + \text{Fe} \rightarrow \text{FeSO}_4 + \text{Cu}$

(blue) (black) (pale green) (reddish brown)  
(iron filings)

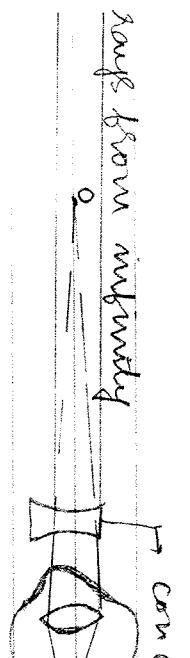

In new reaction, the change in colour of the  
Reactants and products indicate that a chemical  
reaction has taken place.

3. Myopia is caused due to :  
① Excessive curvature of the eye lens.  
② Elongation of the eye ball.

(a)

(b)

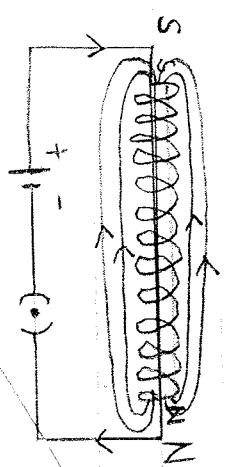

rays from infinity

→ converge lens of suitable power

32. A solenoid is a current carrying coil of many turns wrapped closely in the shape of a cylinder. When electricity is passed through a solenoid, it behaves like a magnet.

Magnetic field lines  
are minimum inside the

solenoid and North -  
South around it.

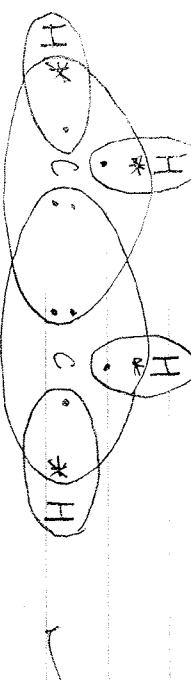

33. (a) (i)  $\frac{1}{10}$  of the total solar energy from the solar  
input is captured by the atmosphere.

(ii)  $10\%$  of energy is available, and thus passed to  
the next trophic level.

(b) Each step or stage of a food chain is known as  
Trophic level.  
Food chains consist of three or four trophic levels.  
Since there amount of energy lost ( $90\%$ ) at each trophic  
level is so great and massive that by the third or  
fourth trophic level there is really less ~~energy~~  
usable energy left.

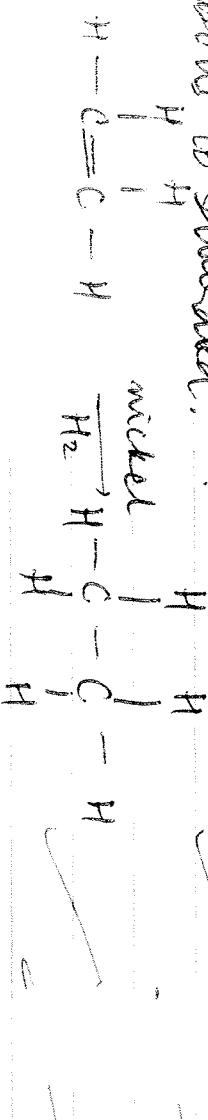

SECTION D

34. (b) i) The compound formed is Ethene [ $\text{CH}_2 = \text{CH}_2$ ]

ii)  $\text{Pt/C}$  acts as the dehydrating agent which removes  $\text{H}_2\text{O}$  (water) from ethanol.

iii) Regeneration is the addition of hydrogen to break in presence of nickel or palladium catalyst to break unsaturated hydrocarbons to saturated.

This is used to break unsaturated vegetable oil to saturated vegetable oil are considered more healthy than saturated animal oils which contain animal fats and are unhealthy. It is used in food industry.

35. (a) Cellular DNA is the information source of making proteins in the cell. DNA provides the blueprint for all structures and functions of cell. Nonexistence of different proteins will thus lead to altered body designs. Proteins determine the function of hormones and enzymes in the body. Altered body design will lead to difference in efficiency of hormones, enzymes and body functions, and variation.

(b) Pollination is the transfer of pollen grains from anthers of a flower to stigma ~~of flower~~ of a flower. If pollination does not occur, the pollen grains will not be able to reach the egg cell for fusion of male and female gametes (fertilization).

(c) It is unsuitable to depend on being cut accidentally for mode of reproduction. The organisms cannot rely on being cut and divided at any point on body.

~~Let~~ Multicellular organisms have specialised cells for different functions. Their cells are divided and differentiated and specific. Thus, they have separate gamete cells for reproduction. Gametes only can differentiate and divide to form tissues for different functions.

(d) Reproductive pre-pagation is used for plants which have lost the ability to produce viable seeds for reproduction. Moreover, reproductive propagation provides very little variations between parent and offspring. Variations are sometimes desirable.

(e) Thus we have the Law of Segregation, which states that during gamete formation, the alleles of genes separate and only one allele for each gene is taken up by the gamete. Thus, gametes are haploid and contain half the no. of chromosomes when the male and female gamete fertilise, they restore the total no. of chromosomes in the offspring.

(f) Resistance of a conductor is the property of the conductor. As a result, it retard the flow of current through it. ~~It~~ 'Ohm' is the unit of resistance. Ohm is the resistance when 1 volt of potential difference is applied across the conductor and 1 ampere of current flows through it.

(ii)

Resistance of rectangular conductor depends on:

- (1) Area of cross-section
- (2) length of the conductor.
- (3) Resistance also varies with temperature.
- (4) Material of the conductor.

(iii)

i) If length is doubled and area of cross-section remains same, it becomes  $2R$

$$\text{Original } R = \frac{Pl}{A}, \text{ new } R_1 = \frac{2Pl}{A}$$

$$\therefore \frac{2Pl}{A} = 2R$$

$\therefore$  Resistance doubles

ii) If length and radius are both doubled,

$$\text{Original } R = \frac{Pl}{A}, \text{ new } = R_1 = \frac{2Pl}{\pi(2r)^2} = \frac{2Pl}{4\pi r^2} = \frac{Pl}{2A}$$

$$\therefore \frac{Pl}{2A} = \frac{R}{2}$$

$\therefore$  Resistance becomes half of initial value

~~3.7.4) Electrochemical Reduction of metal chlorides or oxides  
(st. written ex.)~~

#### SECTION - E

3.7.(a) electrolysis (Electrolytic reduction) of molten ore

(b) Carbon cannot be used as reducing agent to obtain Aluminium from its oxide as ~~Al~~ Aluminium is more reactive and has higher affinity for oxygen than carbon. Thus, carbon would not be able to reduce and displace it.

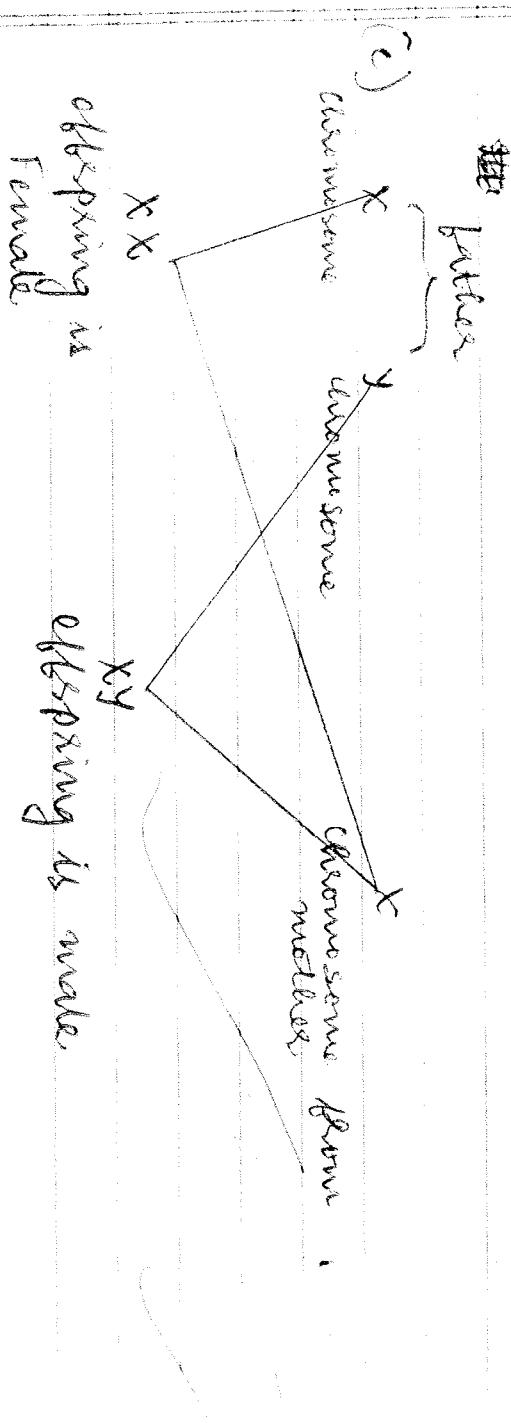

Reaction	Oxidation
1 used to obtain metal oxide from its sulphide ore. 2 occurs / takes place in limited sufficient supply of $O_2$ (air)	& used to obtain metal oxide from its carbonate ore. & occurs / takes place in limited supply / absence of $O_2$ (air)
Eg. $ZnS + 3O_2 \rightarrow ZnO + 2SO_2$	Eg. $ZnCO_3 \rightarrow ZnO + CO_2$

38.

(a) Chromosomes in zygote - 28 pairs - 46 chromosomes  
Chromosomes in each gamete - 23 chromosomes

(b) In New Zealand, the temperature at which the fertilised egg is incubated determines the sex of the offspring. Thus, New Zealand like the lizards, depend on environmental cues.

(c) ~~Women have perfect pair of chromosome XY~~

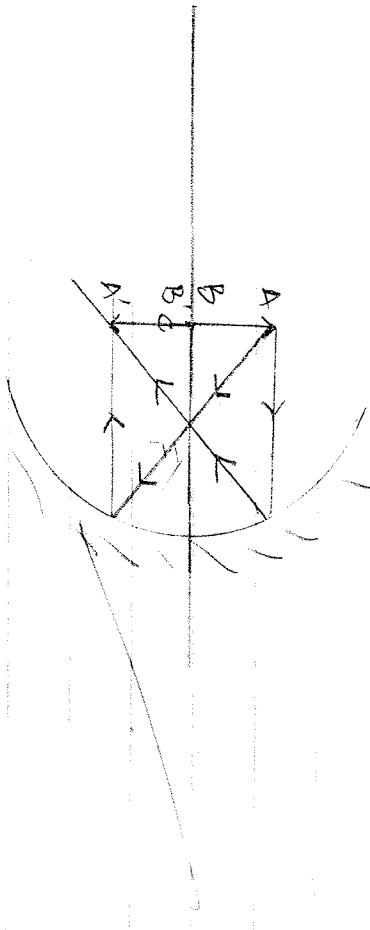

Offspring is female  
Offspring is male

Thus, sex of the ~~boy~~ child is a matter of chance. If no ~~discrepancy~~ is inherited from father, a daughter & (boy) is born. If ~~discrepancy~~ is inherited, a son (boy) is born.

(a) A real, ~~real~~ inverted and diminished (smaller than the object)  $\frac{1}{2}$   $\frac{1}{2}$

(b) In case II, the mirror will form real image of same size. The focal length is 15 cm, thus the radius of curvature =  $2 \times 15 = 30$  cm, where the object is placed. We know, when object is placed at (center of curvature) the image formed is same size as the object, real and inverted.

The dentist use concave mirror in order to see and  
in view the patient's teeth (distinctly) clearly.  
concave mirror can provide enlarged and erect  
image of the teeth.
